QHWM of the “orthogonal” and “symplectic” types Lie subalgebras of the matrix quantum
pseudodifferential operators

Karina H. Batistelli

Universidad Nacional de Córdoba
CIEM–CONICET

In this talk we will characterize the irreducible quasifinite highest weight modules of
some subalgebras of the Lie algebra of matrix quantum pseudodifferential operators $N \times N$.

In order to do this, we will first give a complete description of the anti-involutions that
preserve the principal gradation of the algebra of $N \times N$ matrix quantum pseudodifferential
operators and we will describe the Lie subalgebras of its minus fixed points. We will obtain,
up to conjugation, two families of anti-involutions that show quite different results when
$n = N$ and $n < N$. We will then focus on the study of the “orthogonal” and “symplectic”
type subalgebras found for case $n = N$, specifically the classification and realization of the
quasifinite highest weight modules.
